EDUCATION

Bachelor of Science in Software Engineering

San Jose State University • Spring 2026

• *Braven Project Manager* / *MESA Engineering Society*

• **Coursework:** Software Process Management, Object-Oriented Design, Project Management, Data Structures, Statistical Analysis.

AS in Mathematics, AA Liberal Arts: Math & Science, AA Liberal Arts: Arts and Humanities

West Valley College • Saratoga, CA • 2023

EXPERIENCE

Full Stack Engineer

FFL Enterprises

March 2026 - Present, Santa Clara, CA

- Defined and developed a cost management platform and internal ledger system tracking over \$10 million in annual sales, integrating with QuickBooks for highly accurate inventory tracking and accounting where data correctness is critical.
- Designed system architecture for a modular PostgreSQL/TimescaleDB schema and a split Next.js/Fastify stack with Docker containerization, enabling immediate consistency in a high-volume, BCNF-compliant database.
- Built a robust development infrastructure using GitHub Actions CI/CD with tests covering lint, build sanity, schema drift, Jest API integration, and Playwright E2E.
- Established strict development guardrails within the CI/CD pipeline, enabling the engineering team to safely leverage AI coding assistants to significantly accelerate shipping velocity without compromising codebase integrity.
- Shipped core management workflows end-to-end, delivering dynamic data visualization through Cytoscape.js.

DevOps Architect & Technical Program Management Part Time

Miru Labs

October 2025 - Present, San Jose, CA

- Building a microservice dataflow tracking feature to enable automated incident triaging and ensure the reliability of a distributed backend system.
- Leveraging AWS, Prometheus, and Grafana to monitor and visualize real-time observability pipelines, and authoring Terraform scripts to enforce configuration consistency across deployments.
- Onboarded into an early-stage cybersecurity platform built on a graph-native, microservices architecture with agentic AI capabilities, mapping full infrastructure and service interdependencies.
- Engineered a tiered CI/CD testing pipeline by segmenting local service handshakes, pre-merge unit tests, and full deployment suites, to eliminate redundant execution bottlenecks and accelerate shipping velocity.

Project Manager

Braven

August 2025 - December 2025, San Jose, CA

- Led a cross-functional team through 14 weeks of Agile sprints, managing execution from root cause analysis through final deliverable on a strategic initiative for City Year Bay Area.
- Designed a 3-year roadmap and "City Year to Career" ecosystem, aligning technical solutions to organizational strategy and projected \$17:1 economic ROI.
- Facilitated empathy interviews with executive stakeholders to define requirements and drive prioritization decisions across competing workstreams.
- Delivered a data-driven business case projected to achieve a 75% post-service job placement rate, culminating in a final executive presentation to City Year leadership.

PROJECTS

BeWeal

September 2023 - March 2024

- Led the full 0 to 1 product lifecycle from concept to launch, pioneering a Discord social bot replicating BeReal's functionality.
- Scaled the platform from 10 to 40+ active users across 4 communities through strategic releases, market validation, and feature prioritization.
- Implemented customizable user engagement and retention features derived from user research, enabling server owners to optimize notification timing and frequency.

Systems & Full Stack Engineer

JavaScript Multiplayer Game Engine (JSMGE) • github.com/venajustin/jsmge • August 2024 - December 2025

- Engineered a secure REST API using Python (Flask) and PostgreSQL to handle user authentication (JWT), session management, and persistent stateful data storage across the platform.
- Developed a browser-based IDE using React and Monaco Editor, enabling users to write, execute, and debug JavaScript code within a unified web interface.
- Architected a containerized microservices platform using Docker Compose and Nginx, orchestrating 5+ interconnected services with dynamic provisioning of isolated server environments on-demand.
- Implemented bidirectional real-time communication using Socket.io, achieving sub-second latency for code synchronization and live state updates between the React frontend and Node.js backend.
- Managed deployment configuration and service orchestration across the full stack, handling environment variables, networking, and container health across all services.
- Technologies: JavaScript (React, Node.js, Express), PostgreSQL, Docker & Docker Compose, Nginx, Socket.io, Git.

SKILLS

- **Languages:** TypeScript, JavaScript, Python, Java, SQL, HTML/CSS, C.
- **Frontend:** React, Next.js, Tailwind, Cytoscape.js, Jinja2, Monaco Editor.
- **Backend & Database:** Node.js, Express.js, Fastify, Flask, PostgreSQL, TimescaleDB, SQLite, MariaDB, Kysely, Zod.
- **DevOps & Infrastructure:** AWS, Docker, Docker Compose, Nginx, Terraform, Prometheus, Grafana, GitHub Actions, CI/CD, Git, Linux.
- **Testing & Process:** Jest, Playwright, Agile/Scrum, Jira, Confluence.
